DIMPLES TAKE TO THE AIR

Dimples—usually associated with a lovely woman—have joined the nation's defense effort and are being used by Douglas-Torrance in the manufacture of the F4D Skyray for the U.S. Navy.

The dimples are embossed in large sheets of stainless steel which are presently being used for covering air conditioning vents, heat vents, and to cover the tail cone of the jet engine.

Joseph E. Hagins, 526 Avenue B, Redondo Beach, of the Methods Development Group in Tooling, conceived the idea at the Torrance plant.

Embossing adds strength and aids in the formability of the metal, and also increases heat deflection 100 per cent over flat, unembossed metal.

This represents a definite step forward in metal-forming techniques.

Different sized patterns can be attained by the use of varied grid sizes in the initial forming operation.

The use of titanium is planned for the future as the dimples play an increasingly more important role for Douglas and the U. S. Navy.
